Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Bradley et al., US Patent No. 7,054,507 describes kernel selection for local image content for smoothing and maintaining edge sharpness.

Tan et al., US Patent No. 6,697,534 describes an adaptively sharpening local image content.

Maurer, US Patent No. 6,665,448 describes altering a filter based on local image content and note the prior art discussion at column 1 line 66 to column 2 line 13 which states:

A simpler method for combining smoothing and sharpening is based on linear unsharp masking, (Eq. 1) by modifying the local "sharpness gain factor" $\lambda(i,j)$ such that it has

Art Unit: 2628

positive values (sharpening) in activity regions but negative values (smoothing) in flat regions. The local sharpness gain factor $\lambda(i,j)$ is in fact a soft-decision factor corresponding to a measure of the desired feature (activity). The computational complexity of this method is still relatively high since at each pixel both the high-pass filter response ($H*x$) and the activity measure $\lambda(i,j)$ must be determined. Also, neither the linear high-pass filter nor the activity measure differentiate between dither patterns and directional edges. It is hard to extend this method to handle different activity patterns in different ways, since both the high-pass filter and the activity measure must be redesigned.
